

Cloud Hosting

How to test your Cloud Hosting without changing DNS records

The easiest way to test the functionality of your Cloud Hosting is to use the "hosts" file of your operating system. The hosts file is available in both Windows and Linux operating systems.

Windows - most probably C:\Windows\System32\drivers\etc\hosts

Linux - /etc/hosts

Mac OS X - /private/etc/hosts

The configuration is simple. Let's say you want to resolve your domain example.tld to the IP address 1.2.3.4. In this case you need to edit your hosts file this way:

```
1.2.3.4 example.tld www.example.tld
```

This will "tell" your computer to resolve domain example.tld to IP address 1.2.3.4.

You may also need to clear your web browser's cache.

In case you don't know the IP address of your SnackHost Cloud Hosting, you can find that in DOMAIN DETAILS (Overview) for your domain in SnackHost user interface.

Unique solution ID: #1031
