## PHPMailer configuration

We recommend to use PHPMailer for sending emails from your website. The configuration should look like this:

```
//Server settings
$mail->SMTPDebug = 0;           // Enable verbose debug output
$mail->isSMTP();                // Set mailer to use SMTP
$mail->Host = 'smtp.snackhost.eu';
$mail->SMTPAuth = true;
$mail->Username = 'your_whole_email'; // SMTP username
$mail->Password = 'your_password';   // SMTP password
$mail->SMTPSecure = 'ssl';
$mail->Port = 465;
```

You have to create email in [SnackHost dashboard](#) and use this email for sending
